

AGP Round New Structure Assembly Leaflet

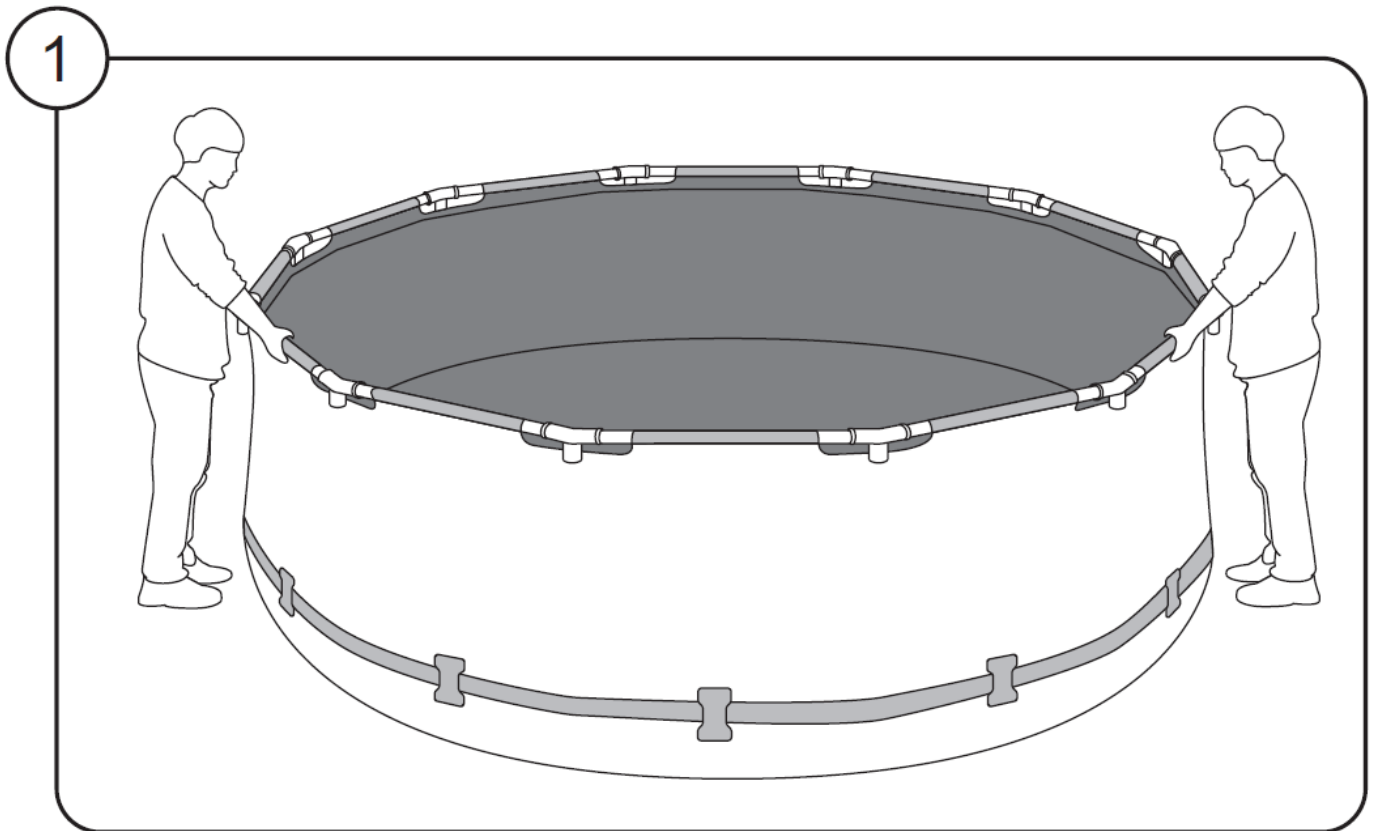

INSTALLATION

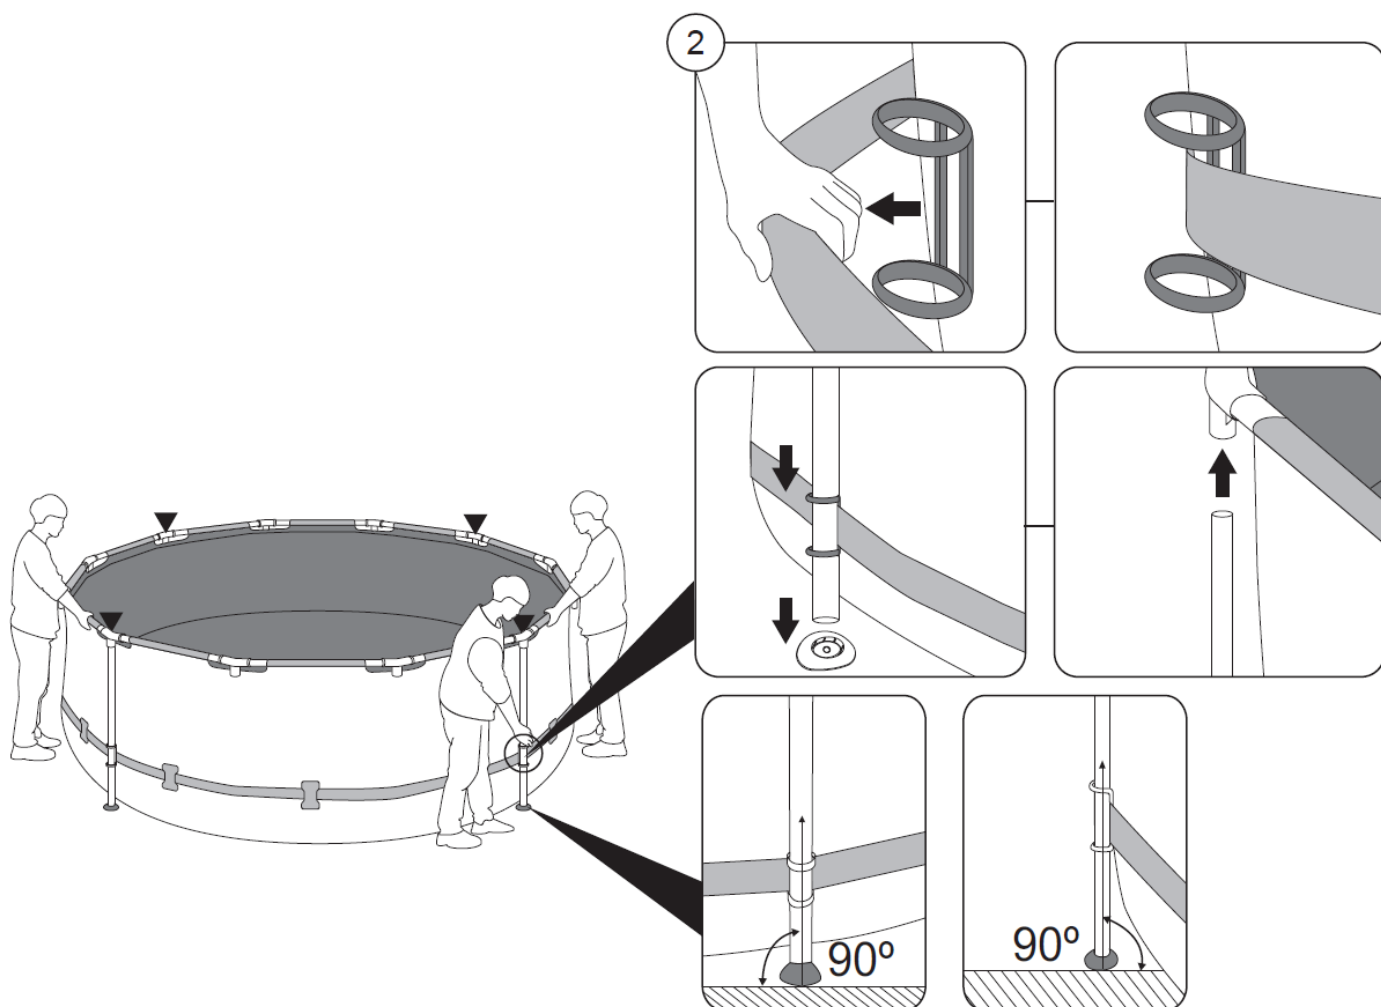

Read the instruction manual to choose the correct location for pool setup. Then, assemble the top rails and T-Connectors. To install the vertical leg structure, scan the QR code or follow the illustrations below. Drawings are for illustration purposes only. May not reflect the actual product. Not to scale.

1. Two or three people are needed for this step. One or two people will lift up the liner, making it easier for the remaining person to install the vertical legs.

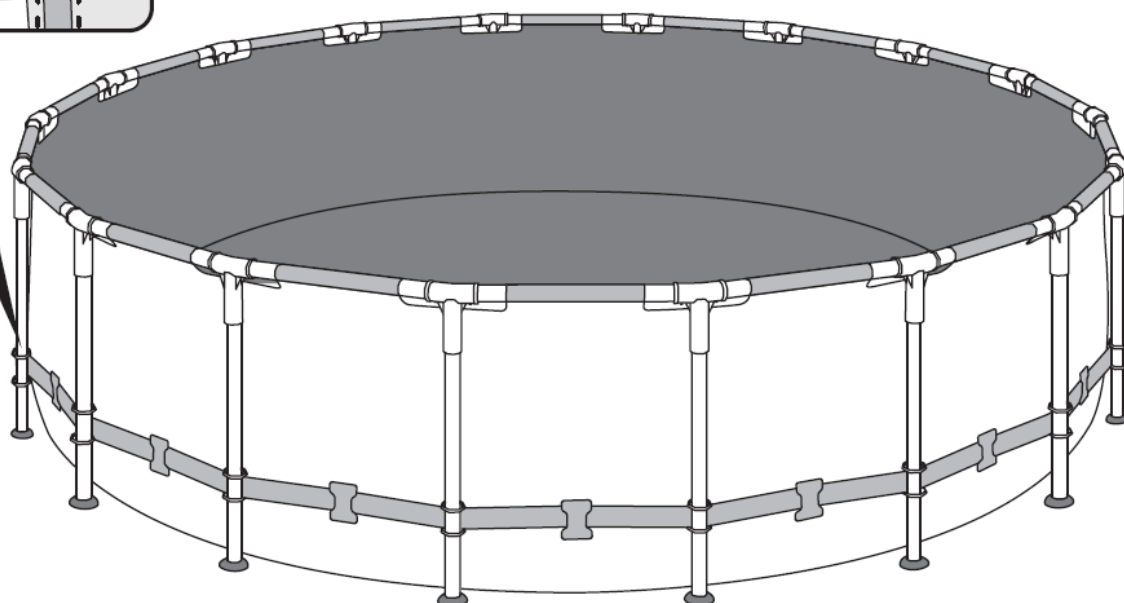

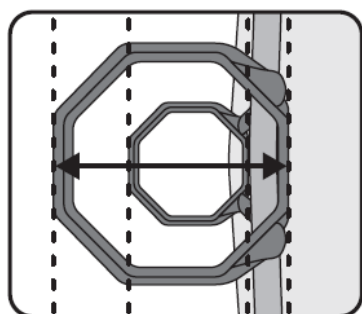

2. Insert each **Plastic Ring** behind the belt of the **Pool Liner**, lining it up with where the **Vertical Legs** will be placed. Ensure a snug fit, then install each **Vertical Leg** through the **Plastic Ring** and into the **Foot Pad**. Connect the leg with the pre-installed **T Connector**. We recommend cross-installing the first four legs, then completing the rest. **IMPORTANT:** Before filling, check that the plastic rings, vertical legs, and belt are installed in the correct position as shown.

Helpful Tip for APX 365™:

Due to the unique structure of the APX 365™ pools, it is essential to pay careful attention when aligning the corners and sides of the frames with the plastic rings during installation. Misalignment of these two components can lead to product damage over time.

After checking, you can continue installing the pool and start filling with water, following the instruction manual.

IMPORTANT: Check the position of the vertical legs at times while filling the pool with water. The legs can gradually change position due to increased water weight. If the legs are not perpendicular to the ground, please stop filling the pool and adjust them. It will help with weight distribution to avoid strain on the frame and liner.
